

Phase anchor:  $\phi = (\text{lag from } r_i \text{ trough to } \lambda \text{ peak}) / T \times 360^\circ$ , wrapped to  $(-180^\circ, +180^\circ]$ .  
 $\phi$  small +  $\rightarrow$  cavity-distance quick response.  $\phi \rightarrow \pm 180^\circ \rightarrow$  half-cycle from trough. Opposite-sign panels  $\rightarrow r_1, r_2$  approximately anti-phase.
